## $90^{\circ}$ Bends

## Back-to Back Benis

Measure length of bend ( X ). Subtract bender deduct (see Table 1) from length $(X)$ and mark this length (see Table 1) from length $(X)$ and mark this length
from the end of the conduit $(Y)$. Line up $(Y)$ with arrow on bender. Bend until $90^{\circ}$ bend is formed.

Measure and mark distance on the conduit from fixed point $(X)$, to the back of the $90^{\circ}$ bend, point $\left(\mathrm{Y}\right.$. Align ( Y ) with (B or $\star$ ) on bender and make a $90^{\circ}$

## Ofisat Bends

Measure height of offset ( $Z$ ) and multiply by a constant multiplier per angle of bend (see Table 2 on next page) to multiplier per angle of bend (see Table 2 on next page) to from end of conduit to offset and add shrinkage (see Table 2 on next page). Mark this length on conduit ( $Y$ ). Subtract distance between bends and mark point (X). Using arrow on bender, make desired bend at point $(X)$. Reverse bender and repeat at point $(Y)$

Because it is flexible, EMT is easy to straighten and will not break if handled as follows. Slip the bender handle over the stub and pull back the desired degree(s) from the bend. For larger conduit sizes, the benderhandle can be replaced by a pipe of correspondingly larger diameter or one small enough to fit inside the conduit, Big mall enough to fit inside the conduit. Back-to-Back Bend

Measure height of offset (D) and multiply by a constant multiplier per angle of bend (see Table 2) to determine distance between bends. Measure length (L) from end of conduit to offset and add shrinkage (see Table 3).
Mark this length on conduit (C). Subtract distance between bends and mark point (X). The first bend should be made at (C), put (STAR) or B at (C). Then make your bends at $(\mathrm{X}) \&(\mathrm{Y})$. Using arrow on bender

## Hickey Bends

Hickey bends are a series of segment bends (not to exceed $10^{\circ}$ per bend) for sharper than standard code radius bends. Bending success with a hickey is directly proportionate to the operator's bending skill.
